About Me

Full Stack & Automation Developer specialising in AI-powered workflows and system integration. At Herion, I was the sole technical hire — designing, building and shipping production systems end-to-end, from LLM document pipelines and voice AI to ERP infrastructure and payment integrations. I pick up new tools fast and deliver independently under real business pressure.

Projects

Automated Scheduling & BI Reporting System

- Reduced shift generation time from several hours to under 5 minutes by designing an end-to-end scheduling automation using n8n, Node.js and webhook-driven triggers deployed across Azure and Railway.
- Enabled real-time workforce analytics for the entire operation by integrating the scheduling engine with Power BI, automatically populating dashboards triggered by form submissions.

Vehicle Expedientes Management System

- Eliminated manual data entry across the full documentation lifecycle by building an LLM-based document processing pipeline using Claude AI and prompt engineering, reducing processing time by an estimated 80%.
- Automated government form submission for every vehicle transaction by chaining AI extraction, data validation and formatted Excel export in a single end-to-end workflow.

AI-Powered Call Center

- Enabled 24/7 inbound and outbound call handling without human intervention by engineering a voice AI agent orchestrated via n8n, Twilio and text-to-speech delivery with automatic fallback routing logic.

All projects built and maintained in production at Herion Spain as the sole developer.

Work Experience

Herion

Spain

Automation & Web Developer

Dic2025 - May2026

- All-round developer in an early-stage startup with no dedicated tech team, taking full ownership of technical decisions and delivery across automation, AI integration, frontend, backend, and cloud infrastructure simultaneously.
- Consistently picked up unfamiliar technologies — including voice infrastructure, LLM-based document processing, BI automation, and payment gateways — and shipped production-ready solutions independently under real business deadlines.
- Comfortable in fast-moving environments with shifting priorities, maintaining multiple live systems while continuing to build new tools and features in parallel.
