About Me

Full Stack & Automation Developer with hands-on experience building and deploying production systems across the full stack — from AI-powered document pipelines and conversational agents to cloud infrastructure and payment integrations. Comfortable taking on any technical challenge in fast-moving environments, learning new tools on the fly, and delivering end-to-end solutions independently

Projects

Automated Scheduling & BI Reporting System

- Designed and deployed an end-to-end scheduling automation that reduced shift generation from hours to minutes, supporting both daily automated runs and on-demand requests via form submission.
- Integrated the scheduling engine with Power BI to automatically populate operational dashboards, enabling real-time workforce analytics and custom report generation triggered by questionnaire responses.
- Deployed across Azure and Railway with a React frontend and Node.js backend, connected via webhook-driven n8n workflows.

Vehicle Expedientes Management System

- Built an intelligent document processing pipeline that ingested vehicle transaction documents, extracted structured data using Claude AI, and automatically populated official administrative forms for submission to government bodies.
- Automated the creation of buyer and seller profiles and full vehicle expedients, eliminating manual data entry across the entire documentation lifecycle.
- Reduced document processing time significantly by chaining AI extraction, data validation, and formatted Excel export in a single automated workflow

AI-Powered Call Center

- Engineered a fully operational inbound/outbound call center that connected callers to a conversational AI agent, enabling natural-language interactions without human intervention.
- Orchestrated the full call flow via n8n — from Twilio voice triggers through AI response generation and text-to-speech delivery — with fallback routing logic for edge cases

Internal ERP System

Led frontend development of a modular internal ERP, building a multi-section React/Vite application with responsive layout, sidebar navigation, and role-based module access.

- Integrated Revolut payment gateway to handle transactions directly within the platform, enabling end-to-end payment processing for internal operations.
- Deployed the full stack on Railway with a Node.js/Express backend and PostgreSQL database.

Work Experience

Herion

Spain

Automation & Web Developer

Dic2025 - May2026

- All-round developer in an early-stage startup with no dedicated tech team, taking full ownership of technical decisions and delivery across automation, AI integration, frontend, backend, and cloud infrastructure simultaneously.
- Consistently picked up unfamiliar technologies — including voice infrastructure, LLM-based document processing, BI automation, and payment gateways — and shipped production-ready solutions independently under real business deadlines.
- Comfortable in fast-moving environments with shifting priorities, maintaining multiple live systems while continuing to build new tools and features in parallel.
